

Service instruction

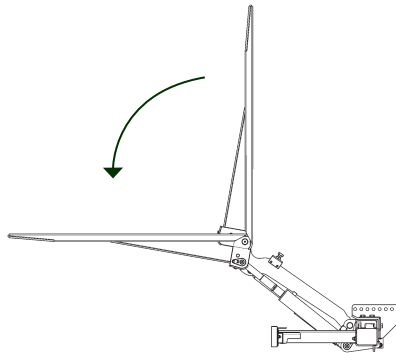

Tail lift

Control of speed:
Lowering, lifting and tilt down

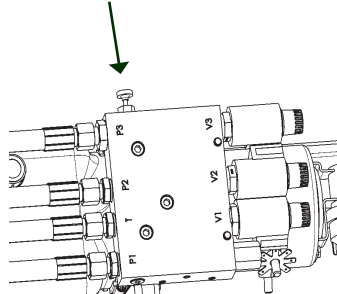

Speed control

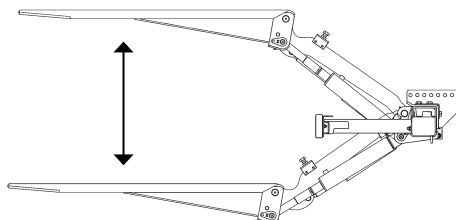

The tilt down speed is preset at the factory. On suspicion of wrong speed, please contact ZeproTechnical Support.

To adjust the speed for tilt down there is an adjustable constant flow valve on the valve block. see figure below. (The figure shows a valve block for Z, ZHD models)

The lowering and lifting speed may not exceed 0.15m per second = 1.5m per 10 seconds.

The lowering and lifting speed are not adjustable, (NB. on some older models they are). If the speed is too high please contact our Technical Support for further information.
